Control Parameter Interface Tool

The Control Parameter tool tells a Batch Macro what values to use for each batch.
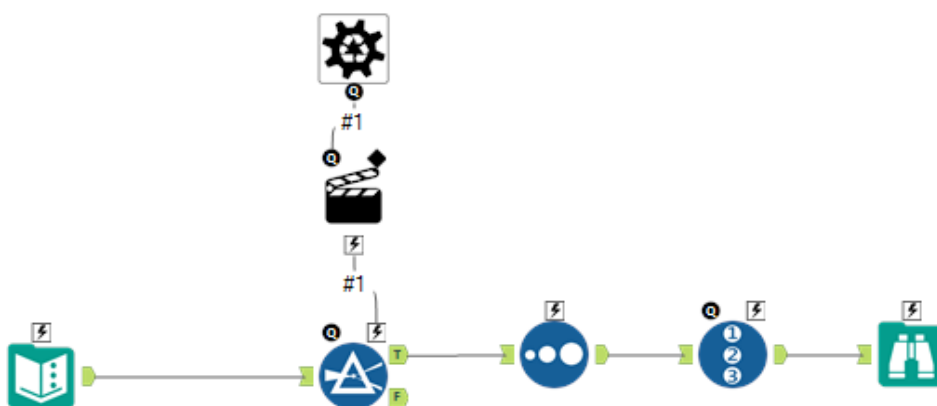

1) Run the workflow.	2) Select a Browse tool to view the results in the Results window.

Use a Control Parameter

The Control Parameter is used to specify what values the macro should use for each batch it processes.

Configure the tool by adding a label for the Control Parameter. When used in a workflow, the macro will show a question asking the end user to select the required column to be used.

More Info

Every Batch Macro must have at least one Control Parameter. Multiple Control Parameters can be used if necessary, the end user will just need to specify each value to be used.

The Control Parameter input will show up with an upside down question mark as shown on the icon to the left. Only 1 Control Parameter input anchor will show even if multiple Control Parameters have been configured. Each column to be used as a Control Parameter will need to be in a single data stream as the input anchor can only accept 1 connection.
